REFLECTION - TEAM PACMAN - ITERATION 4

😃

Both our test persons and the seminar team particularly praised our great and appealing **design**, as well as our implementation in Figma. In the evaluations, the app was also mostly rated as very **intuitive and understandable**. The presentation of the dishes with an appetizing **picture** and the **structure of the main screen** as well as especially of the **recipe screen** were emphasized. The adjustment of the portions and also the cooking video and the "dish of the week" were rated positively by some test persons. In addition, the **user flow** was described as clear and **understandable**, as were the **status displays**. In the heuristic evaluation, more general **help buttons** and icon descriptions in the app bar were desired, which we have added.

😐

Usability / general issues	Possible improvements
pantry storage a bit too crowded and unclearly structured	only show the categories, in which ingredients are selected
search function is not working	implement the search function with java script in the hifi prototype
function of the button "suggest ingredient" on the pantry screen not clear	change the wording, like "add a different ingredient" or "Want to add a missing ingredient?"
app is not responsive (white frame around app in browser)	try to avoid absolute position values and use "min" and "max" as well as flexbox
app is not dynamic and does not provide enough interaction	implement dynamic screen transitions as well as more scrolling options, improve interactions and implement flexible, color changing buttons by using java script and css
